## TACHYKININ ANTAGONISTS

## BACKGROUND OF THE INVENTION

5

Over the last decade, major advances have been made in the understanding of the biology of the mammalian tachykinin neuropeptides. It is now well established that substance-P (1), neurokinin A (NKA) (2), and neurokinin B (NKB) (3), all of which share a common C-terminal sequence Phe-X-Gly-Leu-Met-NH<sub>2</sub>, (Nakanishi S, Physiol Rev 1987;67:117), are widely distributed throughout the periphery and central nervous system (CNS) where they appear to interact with at least three receptor types referred to as NK<sub>1</sub>, NK<sub>2</sub>, and NK<sub>3</sub>, (Guard S, et al., Neurosci Int 1991;18:149). Substance-P displays highest affinity for NK<sub>1</sub> receptors, whereas NKA and NKB bind preferentially to NK<sub>2</sub> and NK<sub>3</sub> receptors, respectively. Recently, all three receptors have been cloned and sequenced and shown to be members of the G-protein-linked "super family" of receptors (Nakanishi S, Annu Rev Neurosci 1991;14:123). A wealth of evidence supports the involvement of tachykinin neuropeptides in a variety of biological activities including pain transmission, vasodilation, smooth muscle contraction, bronchoconstriction, activation of the immune system (inflammatory pain), and neurogenic inflammation (Pernow B, Pharmacol Rev 1983;35:85). However, to date, a detailed understanding of the physiological roles of tachykinin neuropeptides has been severely hampered by a lack of selective, high affinity, metabolically stable tachykinin receptor antagonists that possess both good bioavailability and CNS penetration. Although several tachykinin receptor antagonists have been described (Tomczuk BE, et al.,

- 2 -

Current Opinions in Therapeutic Patents 1991;1:197), most have been developed through the modification and/or deletion of one or more of the amino acids that comprise the endogenous mammalian tachykinins such that the resulting molecules are still peptides that possess poor pharmacokinetic properties and limited in vivo activities.

However, since 1991, a number of high-affinity nonpeptide antagonists have been reported. Snider RM, et al, (Science 1991;251:435), and Garret C, et al, (Proc Natl Acad Sci 1991;88:10208), described CP-96,345 and RP 67580, respectively, as antagonists at the NK<sub>1</sub> receptor, while Advenier C, et al., (Brit J Pharmacol 1992;105:78), presented data on SR 48969 showing its high affinity and selectivity for NK<sub>2</sub> receptors. It is of interest that most of the nonpeptide tachykinin receptor antagonists described to date arose, either directly or indirectly, out of the screening of large compound collections using a robust radioligand binding assay as the primary screen. Recently, FK 888, a "dipeptide" with high affinity for the NK<sub>1</sub> receptor was described (Fujii J, et al., Neuropeptide 1992;22:24).

International Publication Numbers WO 93/01169, WO 93/01165, and WO 93/001160 cover certain nonpeptide tachykinin receptor antagonists.

Substance-P is widely distributed throughout the periphery and central nervous system. It is believed to mediate a variety of biological actions, via an interaction with three receptor types referred to as NK<sub>1</sub>, NK<sub>2</sub>, and NK<sub>3</sub>, including smooth muscle contraction, pain transmission, neuronal excitation, secretion of saliva, angiogenesis, broncho-constriction, activation of the immune system and neurogenic inflammation.

Accordingly, compounds capable of antagonizing the effects of substance-P at NK<sub>1</sub> receptors will be useful in treating or preventing a variety of brain disorders

- 3 -

including pain, anxiety, panic, depression,  
 schizophrenia, neuralgia, and addiction disorders;  
 inflammatory diseases such as arthritis, asthma, and  
 psoriasis; gastrointestinal disorders including  
 5 colitis, Crohn's disease, irritable bowel syndrome, and  
 satiety; allergic responses such as eczema and  
 rhinitis; vascular disorders such as angina and  
 migraine; neuropathological disorders including  
 Parkinson's disease, multiple sclerosis, and  
 10 Alzheimer's disease; and ophthalmic diseases including  
 scleroderma.

The compounds of the invention, NK<sub>1</sub> receptor  
 antagonists, are useful as anti-angiogenic agents for  
 the treatment of conditions associated with aberrant  
 15 neovascularization such as rheumatoid arthritis,  
 atherosclerosis, and tumor cell growth. They will also  
 be useful as agents for imaging NK<sub>1</sub> receptors in vivo  
 in conditions such as ulcerative colitis and Crohn's  
 disease.

# SUMMARY OF THE INVENTION

The invention covers tachykinin antagonists. The  
 25 compounds are nonpeptides which have proved to be  
 highly selective and functional tachykinin antagonists.  
 These compounds are unique in the alkylation/  
 substitution pattern along their back bone.

Compounds of the invention are those of formula

#### DETAILED DESCRIPTION OF THE INVENTION

The following terms are descriptive of the compounds of the instant invention.

The alkyl groups contemplated by the invention include straight, branched, or cyclic carbon chains of from 1 to 8 carbon atoms except where specifically stated otherwise. Representative groups are methyl ethyl, propyl, isopropyl, n-propyl, n-butyl, iso-butyl, sec-butyl, 2-methylhexyl, n-pentyl, 1-methylbutyl, 2,2-dimethylbutyl, 2-methylpentyl, 2,2-dimethylpropyl, n-hexyl, and the like.

The cycloalkyl groups contemplated by the invention comprise those having 3 to 6 carbon atoms.

The alkoxy groups contemplated by the invention comprise both straight and branched carbon chains of from 1 to 6 carbon atoms unless otherwise stated. Representative groups are methoxyl, ethoxy, propoxy, i-propoxy, t-butoxy, and hexoxy.

The term halogen is intended to include fluorine, chlorine, bromine, and iodine.

The term aryl is intended to include substituted or unsubstituted phenyl, naphthyl, biphenyl, and indanyl. The substituents include one or more substituents such as halogens, nitro, alkyl, alkoxy, alkylthio, hydroxy, trifluoromethyl, and others as specified or as would occur to one skilled in the art.

The term arylalkyl is as described above for the two terms individually.

-17-

The term heterocyclic comprises substituted or unsubstituted pyridyl, 2- or 3-indolyl, thienyl, quinolyl, furanyl, isoquinolyl, benzofuranyl, and benzothiophenyl.

The term amide/ester replacement refers to such moieties as ketomethylene, methyleneoxy, tetrazole, 1,2,4-oxadiazole, and thiazole, etc. See for example Fincham, et al, J Med Chem, 1992;35:1472-1482 or Saunders, et al., J Med Chem, 1990;33:1128-1138.

The compounds of the instant invention are highly selective antagonists of the tachykinin receptor.

One such compound (Ex. 15) is an antagonist of the NK<sub>1</sub> receptor in contrast to substance-P methyl ester which is a known selective NK<sub>1</sub> receptor agonist. See Table I below.

<sup>b</sup> McKnight AT, et al., Br J Pharmacol 1991;104:355-60.

As can be seen from the data in Table I above, the compounds of the invention (for example, Ex. 15), is a tachykinin NK<sub>1</sub> receptor antagonist in a number of in vitro NK<sub>1</sub> preparations, i.e., it antagonizes the pharmacological action of the selective NK<sub>1</sub> receptor

-18-

agonist substance-P methylester on these tissues with a  $pK_B$  of about 8. Therefore, it could be of use in therapeutic disorders where attenuation of the  $NK_1$  receptor response is an appropriate form of intervention.

These compounds are active in vivo as  $NK_1$  receptor antagonists (see Table II). They antagonize the ability of a  $NK_1$  receptor selective agonist (SPOMe) to induce plasma protein extravasation in the guinea pig bladder. The protocol is similar to that described by Eglezos, et al., Eur J Pharmacol 1991;209:277-279.

The compounds of the invention were also evaluated in three tachykinin binding assays. For the  $NK_1$  receptor measurement of the binding of [ $^{125}$ I-BH]. Substance-P, 0.1 nM to guinea pig cerebral cortex membranes was measured as in Lee CM, et al, Eur J Pharmacol 1986;130:209 and in Br J Pharmacol 1990;99:767.

For the  $NK_2$  receptor measurement of the binding of [ $^{125}$ I]-iodohistidyl neurokinin A (0.1 nM) to hamster urinary bladder membrane was measured as described in Buck, Shatzer Life Sci 1988;42:2701.

For the  $NK_3$  receptor measurement of the binding of [ $^3$ H]-Senktide (2 nM) to a guinea pig cerebral cortex membrane was taken as described in Lee CM, above.

-19-

See Table III below for the binding data for representative compounds of the invention. This table shows in vitro NK<sub>1</sub> receptor binding data for certain compounds of the invention.

Table II shows the concentration of the compounds of the instant invention which is needed to displace 50% of a specific radioligand ( $[^{125}\text{I}]$  Bolton Hunter labeled Substance-P) from tachykinin NK<sub>1</sub> receptor sites in guinea pig cerebral cortex membranes. It is a measure of the affinity these compounds have for this receptor.

As can be seen from the binding data above, several of these compounds have high affinity for the NK<sub>1</sub> receptor.

Compounds of the invention are expected to be useful in treating disorders mediated by tachykinins such as respiratory disorders, especially asthma.

They are also expected to be useful in treating inflammation such as arthritis, gastrointestinal disorders such as colitis, Crohn's disease, and irritable bowel syndrome.

They are further expected to be useful in treating and/or preventing eye diseases such as dry eye and conjunctivitis.

They are further expected to be useful in treating allergies such as rhinitis (common cold), and eczema.

The compounds are expected to treat vascular disorders such as angina and migraine.

They are further expected to be useful in preventing and/or treating diseases of the central nervous system such as schizophrenia.

pentafluorophenyl) was treated with N-methyl  
benzylamine in EtOAc to give Examples 1-3 when using  
the appropriate tryptophan stereochemistry (i.e.,  
Example 2 uses R-Trp etc). Examples 4-8 were prepared  
5 using the same pentafluorophenyl ester of tryptophan as  
above but this time it was reacted with RS,R or  
S  $\alpha$ -methylbenzylamine using EtOAc as the solvent. The  
compound of Example 35 was prepared by reacting the  
above PFP ester with 3,5 di- CF<sub>3</sub> benzyl alcohol.

In Scheme II (see below) the versatile intermediate, CBZ-tryptophanyl pentafluorophenyl ester was treated with a variety of arylmethanamines. Example 9 was prepared using 4-chlorobenzylamine in ethyl acetate. Similarly, Example 10 was prepared using 1,2,3,4-tetrahydronaphthyl-1-amine under similar conditions to that for Example 9. Another versatile intermediate shown in Scheme II is the N-terminal unprotected tryptophanyl benzylamide, treatment of this in dry dichloromethane with 1-phenylethanol in the presence of 4-nitrophenylchloroformate yielded Example 11.

Scheme III below outlines the synthesis of Examples 12-18,  $\alpha$ -Methyl tryptophan methylester was initially treated with benzylchloroformate in aqueous 1,4-dioxane and in the presence of base to give the  
5 CBZ-protected ester. This ester was then saponified with lithium hydroxide to the corresponding acid which was then treated with dicyclohexylcarbodiimide (DCC) in the presence of pentafluorophenol (PFP-OH) to give  
10 CBZ- $\alpha$ -methyl tryptophan pentafluorophenyl ester. This active ester was treated with benzylamine to give Example 12. The same ester was also treated with N-methylbenzylamine to yield Example 13.  
Examples 14-18, 36, 37, 38, 39, and 40 were prepared again from this PFP-ester using the appropriate amine.

5       The synthetic routes described in Scheme IV below involve the very useful intermediate  $\alpha$ -methyltryptophanyl-1-phenethylamide which can be synthesized from Example 15 by hydrogenation of the CBZ-N-terminal protecting group using Pearlmans catalyst in ethanol. This free amine may then be reacted with the appropriate chloroformate or active carbonate to give Examples 20-22 and 41-54. Example 19 was prepared by the action of the amine on benzyl isocyanate.

As illustrated in Scheme V below, abrine (N-methyl tryptophan) gave benzyloxycarbonyl-abrine when exposed to benzylchloroformate in aqueous 1,4-dioxane in the presence of base. This N-protected abrine was then used to prepare many derivatives having various C-terminal groups. Example 25 was synthesized by preparing an active ester of the abrine derivative with pentafluorophenol and dicyclohexylcarbodiimide then reacting this with N-methylbenzylamine. Similarly, Examples 23, 26, and 28 were prepared by the reaction of this active ester with various aryl amines such as 4-trifluoromethylbenzylamine (Example 26) and 4-chlorobenzylamine (Example 28). Examples 24 and 27 were made by reaction of the same active ester with  $\alpha$ -methylbenzylamine (1-phenethylamine).

Methods for derivatizing the N-terminus of the  
abrine-containing compounds were carried out via the  
methods shown in Scheme VI below. Abrine was treated  
with 9-fluorenylmethylchloroformate in aqueous  
1,4-dioxane with sodium carbonate to give the FMOC-  
protected abrine. The active ester of this  
(PFP-OH,DCC) was then treated with benzylamine in ethyl  
acetate to give the amide which was deprotected under  
the standard conditions of 20% piperidine in DMF. This  
free amine was then treated with 4-chlorobenzyl  
chloroformate, 4-trifluoromethylbenzylchloroformate,  
and 2,3 dimethoxybenzyl-4'-nitrophenyl carbonate to  
give Examples 29, 30, and 31, respectively.

Example 62 was prepared by the method shown in Scheme X below. The methyl ester of tryptophan was converted to the N-formyl derivative which was subsequently treated with (BOC)<sub>2</sub>O to protect the indole nitrogen. The isonitrile was then formed and alkylated with bromoacetonitrile. The resulting product was treated with hydrochloric acid followed by benzylchloroformate to give the urethane. Next, the BOC-group was removed and the ester hydrolysed with lithium hydroxide. The acid was then activated and subsequently condensed with  $\alpha$ -methylbenzylamine.

For preparing pharmaceutical compositions from the compounds of this invention, inert, pharmaceutically acceptable carriers can be either solid or liquid. Solid form preparations include powders, tablets, dispersible granules, capsules, cachets, and suppositories.

A solid carrier can be one or more substances which may also act as diluents, flavoring agents, solubilizers, lubricants, suspending agents, binders, or tablet disintegrating agents; it can also be an encapsulating material.

In powders, the carrier is a finely divided solid which is in a mixture with the finely divided active component. In tablets, the active component is mixed with the carrier having the necessary binding properties in suitable proportions and compacted in the shape and size desired.

For preparing suppository preparations, a low-melting wax such as a mixture of fatty acid glycerides and cocoa butter is first melted and the active ingredient is dispersed therein by, for example, stirring. The molten homogeneous mixture is then poured into convenient sized molds and allowed to cool and solidify.

The powders and tablets preferably contain 5% to about 70% of the active component. Suitable carriers are magnesium carbonate, magnesium stearate, talc, lactose, sugar, pectin, dextrin, starch, tragacanth, methyl cellulose, sodium carboxymethyl cellulose, a low-melting wax, cocoa butter, and the like.

The compounds of the invention include solvates, hydrates, pharmaceutically acceptable salts, and polymorphs (different crystalline lattice descriptors) of the compounds of Formula I.

The compounds of the present invention can have multiple chiral centers in the above Formula I

-42-

depending on their structures. In particular the compounds of the present invention may exist as diastereomers, mixtures of diastereomers, or as the mixed or the individual optical enantiomers. The present invention contemplates all such forms of the compounds. The mixtures of diastereomers are typically obtained as a result of the reactions described more fully below. Individual diastereomers may be separated from mixtures of the diastereomers by conventional techniques such as column chromatography or repetitive recrystallizations. Individual enantiomers may be separated by conventional methods well known in the art such as conversion to a salt with an optically active compound, followed by separation by chromatography or recrystallization and reconversion to the nonsalt form.

Where it is appropriate to form a salt, the pharmaceutically acceptable salts are acetate, benzenesulfonate, benzoate, bicarbonate, bitartrate, bromide, calcium acetate, camsylate, carbonate, chloride, citrate, dihydrochloride, edetate, edisylate, estolate, esylate, fumarate, gluceptate, gluconate, glutamate, glycollylarsanilate, hexylresorcinate, hydrabamine, hydrobromide, hydrochloride, hydroxynaphthoate, iodide, isethionate, lactate, lactobionate, malate, maleate, mandelate mesylate, methylbromide, methylnitrate, methylsulfate, mucate, napsylate, nitrate, pamoate (embonate), pantothenate, phosphate/diphosphate, polygalacturonate, salicylate, stearate, subacetate, succinate, sulfate, tannate, tartrate, theoclate, triethiodide, benzathine, chloroprocaine, choline, diethanolamine, ethylenediamine, meglumine, procaine, aluminum, calcium, lithium, magnesium, potassium, sodium, and zinc.

Cyclodextrin is one suitable inclusion in a pharmaceutical preparation.

-43-

5 The term "preparation" is intended to include the formulation of the active component with encapsulating material as a carrier providing a capsule in which the active component (with or without other carriers) is surrounded by a carrier which is thus in association with it. Similarly, cachets are included.

Tablets, powders, cachets, and capsules can be used as solid dosage forms suitable for oral administration.

10 Liquid form preparations include solutions, suspensions, and emulsions. Sterile water or water-propylene glycol solutions of the active compounds may be mentioned as an example of liquid preparations suitable for parenteral administration. Liquid  
15 preparations can also be formulated in solution in aqueous polyethylene glycol solution.

Aqueous solutions for oral administration can be prepared by dissolving the active component in water and adding suitable colorants, flavoring agents,  
20 stabilizers, and thickening agents as desired. Aqueous suspensions for oral use can be made by dispersing the finely divided active component in water together with a viscous material such as natural synthetic gums, resins, methyl cellulose, sodium carboxymethyl  
25 cellulose, and other suspending agents known to the pharmaceutical formulation art.

Preferably the pharmaceutical preparation is in unit dosage form. In such form, the preparation is divided into unit doses containing appropriate  
30 quantities of the active component. The unit dosage form can be a packaged preparation, the package containing discrete quantities of the preparation, for example, packeted tablets, capsules, and powders in vials or ampoules. The unit dosage form can also be a  
35 capsule, cachet, or tablet itself, or it can be the appropriate number of any of these packaged forms.

## EXAMPLE 42

3-Thienylmethyl [R-(R\*,S\*)]-[1-(1H-indol-3-ylmethyl)-1-methyl-2-oxo-2-[(1-phenylethyl)amino]ethyl]carbamate

Step 1

To a stirred solution of 3-thiophenmethanol (1.14 g, 10 mmol) and 4-nitrophenylchloroformate (2.01 g, 10 mmol) in dichloromethane (50 mL) at 0°C was added dropwise a solution of pyridine (0.79 g, 10 mmol) in dichloromethane (10 mL). Reaction mixture allowed to warm to room temperature overnight. Solvent removed under reduced pressure and residue taken up between EtOAc (50 mL) and 10% citric acid solution (50 mL). Organic phase washed successively with 10% citric acid solution (2 x 30 mL), H<sub>2</sub>O (30 mL), saturated NaHCO<sub>3</sub> solution (2 x 50 mL), and brine (50 mL). Organic phase dried over MgSO<sub>4</sub>, filtered, and solvent removed under reduced pressure. Step 1: N-Benzyloxycarbonyltryptazan

A mixture of tryptazan (PD 018111) (0.09 g, 0.44 mmol), sodium hydrogen carbonate (0.13 g, 1.55 mmol), dibenzylidencarbonate (0.18 g, 0.63 mmol), water (5 mL), and dioxan (5 mL) was stirred at room temperature overnight. The mixture was diluted with water, washed twice with ether, acidified with 1N hydrochloric acid, and extracted with ethyl acetate. The combined extracts were washed with water, dried over  $\text{MgSO}_4$ , filtered, and evaporated to dryness. Recrystallization from ethyl acetate/hexane gave colorless crystals (0.12 g).

[1-(1H-indazol-3-ylmethyl)-2-oxo-  
2-[(1-phenylethyl)amino]ethyl]carbamate

To a solution of N-benzyloxycarbonyl tryptazan (0.12 g, 0.35 mmol) in ethyl acetate (20 mL) was added hydroxybenzotriazole hydrate (0.058 g, 0.38 mmol) followed by dicyclohexylcarbodiimide (0.075 g, 0.36 mmol). After stirring at room temperature for 3 hours, the mixture was filtered and (S)- $\alpha$ -methylbenzylamine (0.055 g, 0.45 mmol) in ethyl acetate (5 mL) was added to the filtrate. After stirring at room temperature overnight, the reaction mixture was

#### Step 4

1,3-Dimethyl-3,4,5-tetrahydro-2(1H)-pyridinone (DMPU) (0.121 mL, 1.0 mmol) was added to a stirred solution of the isonitrile (0.328 g, 1.0 mmol) in anhydrous THF (10 mL) at  $-78^\circ\text{C}$ . To this was added lithiumhexamethyldisilazide (1.1 mL, 1.0 mmol, 1.1 mmol) and the mixture stirred for 30 minutes. Bromoacetonitrile (0.077 mL, 1.1 mmol) was added and the mixture stirred for 1 hour at  $-78^\circ\text{C}$  and then at room temperature for 1.5 hours. The mixture was poured into water (25 mL) and extracted with  $\text{Et}_2\text{O}$  (2 x 25 mL), the combined extracts washed once with brine (25 mL), the  $\text{Et}_2\text{O}$  dried over  $\text{MgSO}_4$ , filtered, and the solvent removed in vacuo. The residue was purified by chromatography on silica using 75% n-hexane/25% EtOAc as eluant giving the product as a white solid (0.315 g, 86%); mp 92-93°C;

#### Step 5

4.7 M HCl in 1,4-dioxan (1.0 mL, 4.7 mmol) was added to a stirred solution of the isonitrile (0.413 g, 1.12 mmol) in EtOAc (10 mL) cooled to 5°C. To this mixture was added water (1.0 mL) and the solution stirred at room temperature for 1 hour. The solvents were removed in vacuo and the residual solid partitioned between saturated NaHCO<sub>3</sub> solution (10 mL) and EtOAc (2 x 25 mL). The combined EtOAc extracts were washed once with brine (25 mL), dried over MgSO<sub>4</sub>, filtered, and the solvent removed in vacuo. The residue was purified by chromatography on silica using 50% n-hexane/50% EtOAc as eluant giving the product as a syrup (0.301 g, 75%).

the product as a syrup which formed a foam out of Et<sub>2</sub>O (0.078 g, 87%);

IR (film): 3358, 2254, 1718, 1457 cm<sup>-1</sup>;

NMR (CDCl<sub>3</sub>): δ 3.27 (1H, d, J = 6.2 Hz, CHHCN); 3.32 (1H, d, J = 8.8 Hz, CHHCN); 3.53-3.63 (2H, m, CH<sub>2</sub> indole); 3.70 (3H, s, CO<sub>2</sub>CH<sub>3</sub>); 5.11 (1H, d, J = 12.1 Hz, OCHHPh); 5.21 (1H, d, J = 12.1 Hz, OCHHPh); 5.87 (1H, s, NHCOO); 7.22-7.45 (10H, m, indole, C<sub>6</sub>H<sub>5</sub>); 8.17 (1H, d, J = 8.2 Hz, indole-NH);

#### Step 8

LiOH-H<sub>2</sub>O (0.040 g, 0.95 mmol) was added to a stirred solution of the methylester (0.070 g, 0.19 mmol) in THF:H<sub>2</sub>O (4 mL, 3:1 mixture) at room temperature. The mixture was stirred at room temperature for 16 hours and the THF removed in vacuo. The residue was diluted with water (10 mL) and extracted once with Et<sub>2</sub>O (10 mL). The aqueous solution was made pH 4 with 5% citric acid solution and the product extracted into EtOAc (3 x 10 mL). The combined EtOAc extracts were dried over MgSO<sub>4</sub>, filtered, and the solvent removed in vacuo giving the product as a foam (0.045 g, 65%);

#### Step 9

N,N'-dicyclohexylcarbodiimide (0.028 g, 0.138 mmol) was added to a stirred solution of the acid (0.045 g, 0.125 mmol) and 1-hydroxybenzotriazole

-128-

monohydrate (0.023 g, 0.150 mmol) in EtOAc (2 mL). The mixture was stirred for 2 hours at room temperature and the N,N'-dicyclohexylurea filtered off. A solution of (S)-(-)- $\alpha$ -methylbenzylamine (0.023 g, 0.188 mmol) in EtOAc (0.5 mL) was added and the mixture stirred at room temperature for 21 hours. The mixture was filtered and diluted with EtOAc (25 mL) and the EtOAc solution washed with 5% citric acid solution (2 x 10 mL), once with saturated NaHCO<sub>3</sub> solution (10 mL), and once with brine (10 mL). The EtOAc solution was dried over MgSO<sub>4</sub>, filtered, and solvent removed in vacuo. The residue was purified by chromatography on silica using 67% n-hexane/33% EtOAc as eluant giving the product as a white amorphous solid (0.023 g, 40%);

18. A compound named 2,3-Dihydro-1H-inden-2-yl [1-(1H-indol-3-ylmethyl)-1-methyl-2-oxo-2-[(1-phenylethyl)amino]ethyl]carbamate.
19. A compound named (2-Fluorophenyl)methyl-[R-(R\*,S\*)]-[1-(1H-indol-3-ylmethyl)-1-methyl-2-oxo-[1-phenylethyl)amino]ethyl]carbamate.
20. A compound named 3-Furanylmethyl [R-(R\*,S\*)]-[1-(1H-indol-3-ylmethyl)-1-methyl-2-oxo-2-[(1-phenylethyl)amino]ethyl]carbamate.
21. A compound named 2-Furanylmethyl [R-(R\*,S\*)]-[1-(1H-indol-3-ylmethyl)-1-methyl-2-oxo-2-[(1-phenylethyl)amino]ethyl]carbamate.
22. A pharmaceutical composition comprising an amount of a compound according to Claim 1 effective to treat respiratory disorders in a mammal suffering therefrom, and a pharmaceutically acceptable carrier.
23. A method for treating respiratory disorders in a mammal comprising administering a therapeutically effective amount of a compound according to Claim 1.

-140-

24. A pharmaceutical composition comprising an amount of a compound according to Claim 1 effective to treat asthma in a mammal suffering therefrom, and a pharmaceutically acceptable carrier.
25. A method for treating asthma in a mammal comprising administering a therapeutically effective amount of a compound according to Claim 1.
26. A pharmaceutical composition comprising an amount of a compound according to Claim 1 effective to treat inflammation in a mammal suffering therefrom, and a pharmaceutically acceptable carrier.
27. A method for treating inflammation in a mammal comprising administering a therapeutically effective amount of a compound according to Claim 1.
28. A pharmaceutical composition comprising an amount of a compound according to Claim 1 effective to treat arthritis in a mammal suffering therefrom, and a pharmaceutically acceptable carrier.
29. A method for treating arthritis in a mammal comprising administering a therapeutically effective amount of a compound according to Claim 1.
30. A pharmaceutical composition comprising an amount of a compound according to Claim 1 effective to treat gastrointestinal disorders in a mammal suffering therefrom, and a pharmaceutically acceptable carrier.

-141-

31. A method for treating gastrointestinal disorders in a mammal comprising administering a therapeutically effective amount of a compound according to Claim 1.
32. A pharmaceutical composition comprising an amount of a compound according to Claim 1 effective to treat ophthalmic diseases in a mammal suffering therefrom, and a pharmaceutically acceptable carrier.
33. A method for treating ophthalmic diseases in a mammal comprising administering a therapeutically effective amount of a compound according to Claim 1.
34. A pharmaceutical composition comprising an amount of a compound according to Claim 1 effective to treat allergies in a mammal suffering therefrom, and a pharmaceutically acceptable carrier.
35. A method for treating allergies in a mammal comprising administering a therapeutically effective amount of a compound according to Claim 1.
36. A pharmaceutical composition comprising an amount of a compound according to Claim 1 effective to treat diseases of the central nervous system in a mammal suffering therefrom, and a pharmaceutically acceptable carrier.
37. A method for treating diseases of the central nervous system in a mammal comprising administering a therapeutically effective amount of a compound according to Claim 1.

-142-

38. A pharmaceutical composition comprising an amount of a compound according to Claim 1 effective to treat migraine in a mammal suffering therefrom, and a pharmaceutically acceptable carrier.
39. A method for treating migraine in a mammal comprising administering a therapeutically effective amount of a compound according to Claim 1.
40. A pharmaceutical composition comprising an amount of a compound according to Claim 1 effective to treat inflammatory pain or neurogenic inflammation in a mammal suffering therefrom, and a  
5 pharmaceutically acceptable carrier.
41. A method for treating inflammatory pain or neurogenic inflammation in a mammal comprising administration of therapeutically effective amounts of a compound according to Claim 1.
42. A pharmaceutical composition comprising an amount of a compound according to Claim 1 effective to treat rheumatoid arthritis in a mammal suffering therefrom, and a pharmaceutically acceptable  
5 carrier.
43. A method for treating rheumatoid arthritis in a mammal comprising administration of therapeutically effective amounts of a compound according to Claim 1.

-143-

- 5 44. A pharmaceutical composition comprising an amount of a compound according to Claim 1 effective to treat atherosclerosis in a mammal suffering therefrom, and a pharmaceutically acceptable carrier.
45. A method for treating atherosclerosis in a mammal comprising administration of therapeutically effective amounts of a compound according to Claim 1.
- 5 46. A pharmaceutical composition comprising an amount of a compound according to Claim 1 effective to treat tumor cell growth in a mammal suffering therefrom, and a pharmaceutically acceptable carrier.
47. A method for treating tumor cell growth in a mammal comprising administration of therapeutically effective amounts of a compound according to Claim 1.
48. A diagnostic useful in imaging NK<sub>1</sub> receptors in vivo.
49. A compound selected from the group consisting of:  
     (R)-Trp (S)-NHCH(CH<sub>3</sub>)-phenyl,  
     (R)-α-MeTrp (S)-NHCH(CH<sub>3</sub>)-phenyl, and  
     (S)-Trp N(CH<sub>3</sub>)CH<sub>2</sub>-phenyl.
50. A compound of formula

wherein R, R<sup>1</sup>, and R<sup>2</sup> are as defined in Claim 1.

## \* Special categories of cited documents :

- "A" document defining the general state of the art which is not considered to be of particular relevance  
 "E" earlier document but published on or after the international filing date  
 "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)  
 "O" document referring to an oral disclosure, use, exhibition or other means  
 "P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

## INTERNATIONAL SEARCH REPORT

International application No.

PCT/US 93/07552

**Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)**

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  
Although claims \*.\*. are directed to a method of treatment of (diagnostic method practised on) the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.  
\*\* Claims 23,25,27,29,31,33,35,37,39,41,43,45 and 47
2. ☐ Claims Nos.:  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:  
The structural formula of claim 50 is meaningless as it can not be found out at which position the \* - group is attached to the  $\alpha$ -MeTrp moiety  
Claim 50 has not been searched 
$$\begin{array}{c} * \\ | \\ R_1 \\ | \\ R-C-(R) \\ | \\ R_2 \end{array}$$
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

**Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)**

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

**Remark on Protest**

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
